```
A, Description: dissolves the fibrin of blood clots; acts as a proteolytic factor in a vins the walls of the graafian follicle; also activates the urokinase-type plasminogen act A, Pathway: fibrinolysis
C, Superfamily: plasmin; kringle homology; plasminogen-related protein precursor homology; C, Keywords: fibrinolysis; glycoprotein; hydrolase; kidney; kringle; plasma; serine protein prot
                                                                                                                                                                                                                                                                            F;561-783/Domain: trypsin homology <TRY>

A;Description: dissolves the fibrin of blood clots; acts as a proteolytic factor in a value of the walls of the grasfian follicle; also activates the urokinase-type plasminogen act A;Pathway: fibrinolysis
C;Superfamily: plasmin; kringle homology; plasminogen-related protein precursor homology C;Keywords: duplication; fibrinolysis; glycoprotein; hydrolase; kidney; kringle; plasma; F;1-26/Domain: signal sequence #status predicted <SIG> F;8-103/Domain: plasminogen-related protein precursor homology <PUPH> F;27-812/Product: plasminogen #status experimental <APT> F;27-103/Domain: activation peptide #status experimental <APT> F;104-583/Domain: plasmin chain A #status experimental <AAT> F;104-583/Domain: plasmin chain A #status experimental <ACH> F;104-583/Domain: kringle homology <KR1>
                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Molecule type: mRNA

A; Molecule type: protein A; Residues: 20-25 <LIJ> A; Accession: S48203 A; Accession: S48202

C;Comment: Plasminogen is synthesized by the kidney and is present in plasma and many o C;Comment: Plasminogen is converted into plasmin by plasminogen activators, both plasmi mediately after dissociation from the clot. In the presence of the inhibitor, the activation involves also removal of the activation peptide. C;Comment: Stromelysin 1 (see PIR:KCMSS1) acts on plasminogen to produce angiostatin. T eful in treating solid tumors. A; Molecule type: protein A; Residues: 22-27 <LI2> C; Comment: Plasminogen is

A; Description: dissolves the fibrin of blood clots; acts as a proteolytic ns the walls of the graafian follicle; also activates the urokinase-type p A; Pathway: fibrinolysis A; Pathway: fib: C; Superfamily: urokinase-type plasminogen factor in b

kringle homology; plasminogen-related protein precursor homolog

         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                 11535

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -OCT-1989
                                          MISCELLANEOUS: Plasmin is inactivated by alpha-2-antiplasmin immediately after dissociation from the clot.

MISCELLANEOUS: In the presence of the inhibitor, the activative involves only cleavage after Arg-580, resulting in 2 chains involves only cleavage after Arg-580, resulting in 2 chains involves by 2 disulfide bonds. Without the inhibitor, the activation involves also removal of the activation peptide.

SIMILARITY: Belongs to the peptidase S1 family. Plasminogen
                                                                                                                                                                                                                                                                                         a proteolytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follicle. It activates the urokinase-type plasminogen activator, collagenases and several complement zymogens, such as C1 and C5. It cleaves fibrin, fibronectin, thrombospondin, laminin and von Willebrand factor.

CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-xaa > Arg-|-Xaa
         subfamily.
SIMILARITY: Contains 5
                                                                                                                                                                             ENZYME REGULATION: Converted into plasmin by plasminogen activators, both plasminogen and its activator being bound fibrin. Activated with catallytic amounts of streptokinase. SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                 products.

"Identification of the rat Heymann nephritis autoantigen (GP330) as receptor site for plasminogen.";

J. Biol. Chem. 266:10825-10829 (1991).

-I- FUNCTION: Plasmin dissolves the fibrin of blood clots and acts a proteolytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follicle. It activates the urokinase-type plasminogen activator, collagenases and several complement zymogens, such as C1 and C5. It cleaves fibrin, fibronectin, thrombospondin, laminin and von willebrand factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NON_TER

It activates the urokinase-type plasminogen activator, collagenases and several complement zymogens, such as C1 and C5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 products.

Immediately after dissociation from the clot. MISCELLANEOUS: In the presence of the inhibitor, the activat involves only cleavage after Arg-581, resulting in 2 chains together by 2 disulfide bonds. Without the inhibitor, the activation involves also removal of the activation peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                metastatic tumors in vivo.

MISCELLANEOUS: In the presence of the inhibitor, the activation involves only cleavage after Arg-576, resulting in 2 chains held together by 2 disulfide bonds. Without the inhibitor, the activation involves also removal of the activation peptide (By
